

Generating Clean Energy

How do we power our world without adding greenhouse gases?

Non-Renewable Energy

Oil, gas and coal are non-renewable sources of fuel.

They are found underground. They are the remains of ancient forests compressed between layers of rock over millions of years.

Once they are used up they are gone forever. They cannot be renewed.

Clean Energy

Why are some forms of energy considered better than others in terms of the environment?

Which methods of generating electricity are considered 'clean'?

Which methods of generating electricity add pollution to the environment?
